# LCD controllers/drivers

Rev. 11 — 15 July 2013

**Product data sheet** 

# 1. General description

The PCF2119x is a low power CMOS¹ LCD controller and driver, designed to drive a dot matrix LCD display of 2-lines by 16 characters or 1-line by 32 characters with  $5 \times 8$  dot format. All necessary functions for the display are provided in a single chip, including on-chip generation of LCD bias voltages, resulting in a minimum of external components and lower system current consumption. The PCF2119x interfaces to most microcontrollers via a 4-bit or 8-bit bus or via the 2-wire  $I^2$ C-bus. The chip contains a character generator and displays alphanumeric and kana (Japanese) characters.

The letter 'x' in PCF2119x characterizes the built-in character set. Various character sets can be manufactured on request. In addition 16 user defined symbols ( $5 \times 8$  dot format) are available.

# 2. Features and benefits

- Single-chip LCD controller and driver
- 2-line display of up to 16 characters plus 160 icons or 1-line display of up to 32 characters plus 160 icons
- $5 \times 7$  character format plus cursor;  $5 \times 8$  for kana (Japanese) and user defined symbols
- Reduced current consumption while displaying icons only
- Icon blink function
- On-chip:
  - Configurable 4, 3, or 2 times voltage multiplier generating LCD supply voltage, independent of V<sub>DD</sub>, programmable by instruction (external supply also possible)
  - ◆ Temperature compensation of on-chip generated V<sub>LCDOUT</sub>: -0.16 %/K to -0.24 %/K (programmable by instruction)
  - Generation of intermediate LCD bias voltages
  - Oscillator requires no external components (external clock also possible)
- Display Data RAM (DDRAM): 80 characters
- Character Generator ROM (CGROM): 240 characters (5 × 8)
- Character Generator RAM (CGRAM): 16 characters (5 × 8); 4 characters used to drive 160 icons, 8 characters used if icon blink feature is used in application
- 4-bit or 8-bit parallel bus and 2-wire I<sup>2</sup>C-bus interface
- Manufactured in silicon gate CMOS process
- 18 row and 80 column outputs
- Multiplex rates 1:18 (2-line display or 1-line display), 1:9 (for 1-line display of up to 16 characters and 80 icons) and 1:2 (for icon only mode)

<sup>1.</sup> The definition of the abbreviations and acronyms used in this data sheet can be found in Section 20.

LCD controllers/drivers

- Uses common 11 code instruction set (extended)
- Logic supply voltage: V<sub>DD1</sub> V<sub>SS1</sub> = 1.5 V to 5.5 V (chip may be driven with two battery cells)
- LCD supply voltage: V<sub>LCDOUT</sub> V<sub>SS2</sub> = 2.2 V to 6.5 V
- V<sub>LCD</sub> generator supply voltage: V<sub>DD2</sub> V<sub>SS2</sub> = 2.2 V to 4 V and V<sub>DD3</sub> V<sub>SS2</sub> = 2.2 V to 4 V
- Direct mode to save current consumption for icon mode and multiplex drive mode 1:9 (depending on V<sub>DD2</sub> value and LCD liquid properties)
- Very low current consumption (20 μA to 200 μA):
  - Icon mode: < 25 μA</p>
  - ◆ Power-down mode: < 2 μA</p>
- Icon mode is used to save current. When only icons are displayed, a much lower LCD operating voltage can be used and the switching frequency of the LCD outputs is reduced; in most applications it is possible to use V<sub>DD</sub> as LCD supply voltage

# 3. Applications

- Telecom equipment
- Portable instruments
- Point-of-sale terminals

# 4. Ordering information

Table 1. Ordering information

| Type number | Package  |             |          |
|-------------|----------|-------------|----------|
|             | Name     | Description | Version  |
| PCF2119AU   | bare die | 168 bumps   | PCF2119x |

|                        |                    | <ul> <li>data bus line DB3 has an alternative function (SA0) as the<br/>I<sup>2</sup>C-bus address pin</li> </ul>              |
|                        |                    | <ul> <li>each data line has its own internal pull-up resistor</li> </ul>   |
| OSC                    | 168                | oscillator or external clock input   |
|                        |                    | <ul> <li>when the on-chip oscillator is used this pin must be<br/>connected to V<sub>DD1</sub></li> </ul>                      |

- [1] Always put  $V_{DD2} = V_{DD3}$ .
- [2] When the I<sup>2</sup>C-bus is used, the parallel interface pin E must be LOW.
- [3] The substrate (rear side of the die) is wired to  $V_{SS}$  but should not be electrically connected.
- [4] On the device connected to  $V_{SS1}$ .
- [5] When the parallel bus is used, the pins SCL and SDA must be connected to V<sub>SS1</sub> or V<sub>DD1</sub>; they must not be left open-circuit.
- [6] In the  $I^2$ C-bus read mode, ports DB7 to DB4 and DB2 to DB0 should be connected to  $V_{DD1}$  or left open-circuit.
- [7] When the 4-bit interface is used without reading out from the PCF2119x (bit RW is set permanently to logic 0), the unused ports DB4 to DB0 can either be set to V<sub>SS1</sub> or V<sub>DD1</sub> instead of leaving them open-circuit.

# LCD controllers/drivers

# 8. Functional description

# 8.1 Oscillator and timing generator

The internal logic and the LCD drive signals of the PCF2119x are timed by the frequency  $f_{clk}$  which equals either the built in oscillator frequency  $f_{osc}$  or an external clock frequency  $f_{clk(ext)}$ .

#### 8.1.1 Timing generator

The timing generator produces the various signals required to drive the internal circuitry. Internal chip operation is not disturbed by operations on the data buses.

# 8.1.2 Internal clock

To use the on-chip oscillator, pin OSC must be connected to V<sub>DD1</sub>. The on-chip oscillator provides the clock signal for the display system. No external components are required.

#### 8.1.3 External clock

If an external clock will be used, the input is at pin OSC. The resulting display frame frequency is given by:

$$f_{fr} = \frac{f_{osc}}{3072} \tag{1}$$

**Remark:** Only in the power-down mode the clock is allowed to be stopped (pin OSC connected to  $V_{SS}$ ), otherwise the LCD is frozen in a DC state, which is not suitable for the liquid crystals.

### 8.2 Reset function and Power-On Reset (POR)

The PCF2119x must be reset externally when power is turned on. If no external reset is performed, the chip might start-up in an unwanted state.

For the external reset, pin POR has to be active HIGH. The reset has to be active for at least 3 oscillator periods in order for the reset to be executed. If the internal oscillator is used, the minimum reset activity time follows from the lowest possible oscillator frequency ( $f_{osc}$  = 140 kHz,  $T_{osc} \sim 71~\mu s$ ,  $3 \times T_{osc} \sim 215~\mu s$ ). The internal oscillator start-up time is 200  $\mu s$  (typ) up to 300  $\mu s$  (max) after power-on. In case that an external oscillator is used,  $T_{osc}$  is dependent from  $f_{osc(ext)}$ .

Afterwards the chip executes the Clear\_display instruction, which requires 165 oscillator cycles. After the reset the chip has the state shown in <u>Table 5</u> and is then ready for use.

LCD controllers/drivers

Table 5. State after reset

| Step | Function                             | Control bit and register state             | Description   | Reference |

<sup>[1]</sup> The Busy Flag (BF) indicates the busy state (bit BF = 1) until initialization ends. The busy state lasts 2 ms. The chip may also be initialized by software (see <u>Table 45</u> and <u>Table 46</u>).

#### 8.3 Power-down mode

The chip can be put into power-down mode by applying a HIGH-level to pin PD. In power-down mode all static currents are switched off (no internal oscillator, no bias level generation and all LCD outputs are internally connected to  $V_{SS}$ ).

During power-down, information in the RAM and the chip state are preserved. Instruction execution during power-down is possible when pin OSC is externally clocked.

LCD controllers/drivers

# 8.4 LCD supply voltage generator

The LCD supply voltage may be generated on-chip. The  $V_{LCD}$  generator is controlled by two internal 6-bit registers:  $V_A$  and  $V_B$ . Register  $V_A$  is programmed with the voltage for character mode and register  $V_B$  with the voltage for icon mode.

The nominal LCD operating voltage at room temperature is given by Equation 2:

$$V_{LCD(nom)} = V_x \times 0.08 + 1.82$$
 (2)

Where  $V_x$  is the integer value of the register  $V_A$  or  $V_B$ .

V<sub>LCD</sub> is sometimes referred as the LCD operating voltage (V<sub>oper</sub>).

### 8.4.1 Programming ranges

Possible values for  $V_A$  and  $V_B$  are between 0 to 63.

Table 6. Values of  $V_A$  and  $V_B$  and the corresponding  $V_{LCD}$  values

All values at  $T_{ref} = 27$  °C; allowed values are highlighted.

| Integer values of V <sub>A</sub> and V <sub>B</sub> | Corresponding value of V <sub>LCD</sub> in V | Integer values of V <sub>A</sub> and V <sub>B</sub> | Corresponding value of V <sub>LCD</sub> in V | Integer values of V <sub>A</sub> and V <sub>B</sub> | Corresponding value of V <sub>LCD</sub> in V |
|---|--|---|--|---|--|
| 0   | V <sub>LCD</sub> switched off                | 22  | 3.58   | 44  | 5.34   |
| 1   | 1.90   | 23  | 3.66   | 45  | 5.42   |

LCD controllers/drivers

#### Remarks:

- Values producing more than 6.5 V at operating temperature are not allowed.
   Operation above this voltage may damage the device. When programming the operating voltage, the temperature coefficient of V<sub>LCDOUT</sub> must be taken into account.
- Values below 2.2 V are below the specified operating range of the chip and are therefore not allowed.

When the LCD supply voltage is generated on-chip, the  $V_{LCD}$  pins should be decoupled to  $V_{SS}$  with a suitable capacitor. The generated  $V_{LCDOUT}$  is independent of  $V_{DD}$  and is temperature compensated.

In Equation 2 the internal charge pump is not considered. However, if the supplied voltage to  $V_{DD2}$  and  $V_{DD3}$  is below the required  $V_{LCD}$ , it is necessary to use the internal charge pump. The multiplication factor indicates the number of stages used to increase the voltage. At multiplication factor 2 one, at multiplication factor 3 two and at multiplication factor 4, tree stages are used. A multiplication factor of for example, 4 does not mean that a voltage of  $4 \times V_{DD2,3}$  is generated in the internal high-voltage generator. The charge pump is part of a control loop. This means that the control loop aims to regulate  $V_{LCD}$  at the programmed value.

The ITO track resistance limit the speed by which the capacitors can be charged. The multiplication factor exceeds the required  $V_{LCD}$  under all circumstances (that is, at low temperatures and along with the temperature compensation, see Section 10.2.2.4). If still a higher multiplication factor is chosen,  $V_{LCD}$  will remain as set by Equation 2 but the ripple will increase. The increase in ripple can be counteracted by increasing the external decoupling capacitor at  $V_{LCD}$ . A higher multiplication factor will also result in a higher current consumption (see Section 16.6). However the current that can be delivered will be higher, for example, for larger display area.

When the  $V_{LCD}$  generator and the direct mode are switched off, an external voltage may be supplied at connected pins  $V_{LCDIN}$  and  $V_{LCDOUT}$ .  $V_{LCDIN}$  and  $V_{LCDOUT}$  may be higher or lower than  $V_{DD2}$ .

In direct mode (see Icon\_ctl instruction, Section 10.2.3.3) the internal  $V_{LCD}$  generator is turned off and the  $V_{LCDOUT}$  output voltage is directly connected to  $V_{DD2}$ . This reduces the current consumption depending on  $V_{DD2}$  value and LCD liquid properties.

The  $V_{LCD}$  generator ensures that, as long as  $V_{DD2}$  and  $V_{DD3}$  are in the valid range (2.2 V to 4 V), the required peak voltage  $V_{LCD}$  = 6.5 V can be generated at any time.

### 8.5 LCD bias voltage generator

The intermediate bias voltages for the LCD display are also generated on-chip. This removes the need for an external resistive bias chain and significantly reduces the system current consumption. The optimum value of  $V_{LCD}$  depends on the multiplex rate, the LCD threshold voltage ( $V_{th}$ ) and the number of bias levels. Using a 5-level bias scheme for the 1:18 multiplex rate allows  $V_{LCD} < 5$  V for most LCD liquids.

The intermediate bias levels for the different multiplex rates are shown in <u>Table 7</u>. These bias levels are automatically set to the given values when switching to the corresponding multiplex rate.

LCD controllers/drivers

Table 7. Bias levels as a function of multiplex rate

| Multiplex | Number of   | Bias v         | Bias voltages                   |                                 |                                 |                                 |                |  |  |  |  |  |  |  |  |
|-----------|-------------|----------------|---------------------------------|---------------------------------|---------------------------------|---------------------------------|----------------|--|--|--|--|--|--|--|--|
| rate      | bias levels | V <sub>1</sub> | V <sub>2</sub>                  | V <sub>3</sub>                  | V <sub>4</sub>                  | V <sub>5</sub>                  | V <sub>6</sub> |  |  |  |  |  |  |  |  |
| 1:18      | 5           | $V_{LCD}$      | $\frac{3}{4}(V_{LCD} - V_{SS})$ | $\frac{1}{2}(V_{LCD} - V_{SS})$ | $\frac{1}{2}(V_{LCD} - V_{SS})$ | $\frac{1}{4}(V_{LCD} - V_{SS})$ | $V_{SS}$       |  |  |  |  |  |  |  |  |
| 1:9       | 5           | $V_{LCD}$      | $\frac{3}{4}(V_{LCD} - V_{SS})$ | $\frac{1}{2}(V_{LCD} - V_{SS})$ | $\frac{1}{2}(V_{LCD} - V_{SS})$ | $\frac{1}{4}(V_{LCD} - V_{SS})$ | $V_{SS}$       |  |  |  |  |  |  |  |  |
| 1:2       | 4           | $V_{LCD}$      | $\frac{2}{3}(V_{LCD} - V_{SS})$ | $\frac{2}{3}(V_{LCD} - V_{SS})$ | $\frac{1}{3}(V_{LCD} - V_{SS})$ | $\frac{1}{3}(V_{LCD} - V_{SS})$ | $V_{SS}$       |  |  |  |  |  |  |  |  |

The RMS on-state voltage  $(V_{on(RMS)})$  for the LCD is calculated with <u>Equation 3</u> and the RMS off-state voltage  $(V_{off(RMS)})$  with <u>Equation 4</u>:

$$V_{on(RMS)} = V_{LCD} \sqrt{\frac{a^2 + 2a + n}{n \times (1 + a)^2}}$$
 (3)

$$V_{off(RMS)} = V_{LCD} \sqrt{\frac{a^2 - 2a + n}{n \times (1 + a)^2}}$$

$$(4)$$

where the values of a are

a = 2 for  $\frac{1}{4}$  bias

a = 3 for  $\frac{1}{5}$  bias

and the values for n are

n = 2 for 1:2 multiplex rate

n = 9 for 1:9 multiplex rate

n = 18 for 1:18 multiplex rate.

Discrimination (D) is the ratio of  $V_{on(RMS)}$  to  $V_{off(RMS)}$  and is determined from Equation 5.

Discrimination is a term which is defined as the ratio of the on and off RMS voltage across a segment. It can be thought of as a measurement of contrast.

$$D = \frac{V_{on(RMS)}}{V_{off(RMS)}} = \sqrt{\frac{(a+1)^2 + (n-1)}{(a-1)^2 + (n-1)}}$$
 (5)

# 8.5.1 Electro-optical performance

Suitable values for  $V_{\text{on}(RMS)}$  and  $V_{\text{off}(RMS)}$  are dependant on the LCD liquid used. The RMS voltage, at which a pixel will be switched on or off, determine the transmissibility of the pixel.

For any given liquid, there are two threshold values defined. One point is at 10 % relative transmission (at  $V_{low}$ ) and the other at 90 % relative transmission (at  $V_{high}$ ), see <u>Figure 3</u>. For a good contrast performance, the following rules should be followed:

$$V_{on(RMS)} \ge V_{high} \tag{6}$$

PCF2119X

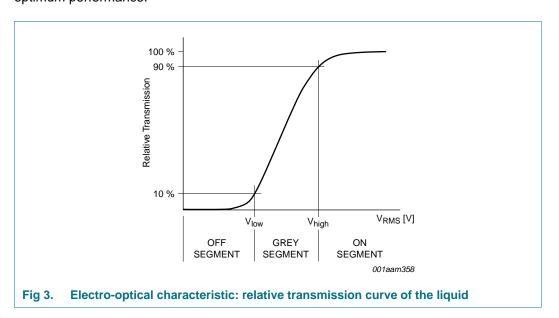

LCD controllers/drivers

$$V_{off(RMS)} \le V_{low} \tag{7}$$

 $V_{on(RMS)}$  and  $V_{off(RMS)}$  are properties of the display driver and are affected by the selection of a, n (see Equation 3 to Equation 5) and the  $V_{LCD}$  voltage.

 $V_{\text{low}}$  and  $V_{\text{high}}$  are properties of the LCD liquid and can be provided by the module manufacturer.

It is important to match the module properties to those of the driver in order to achieve optimum performance.

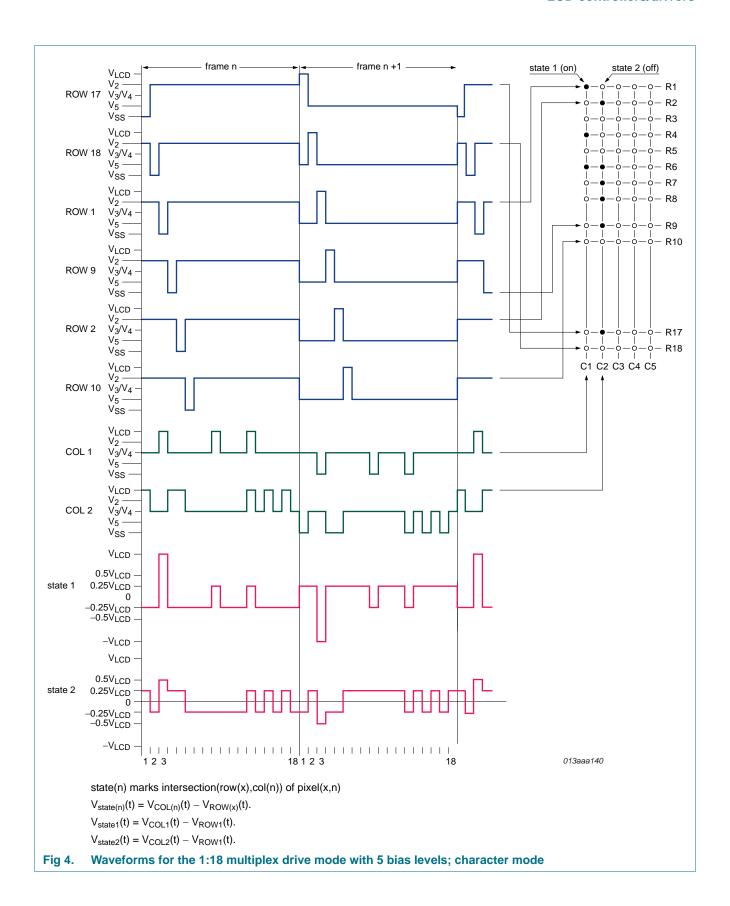

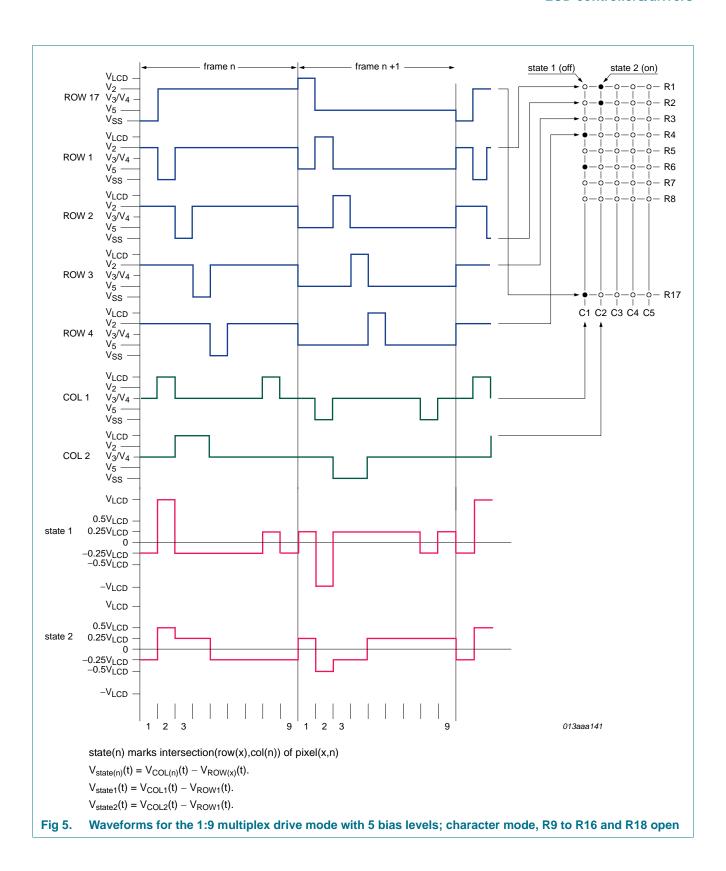

# 8.6 LCD row and column drivers

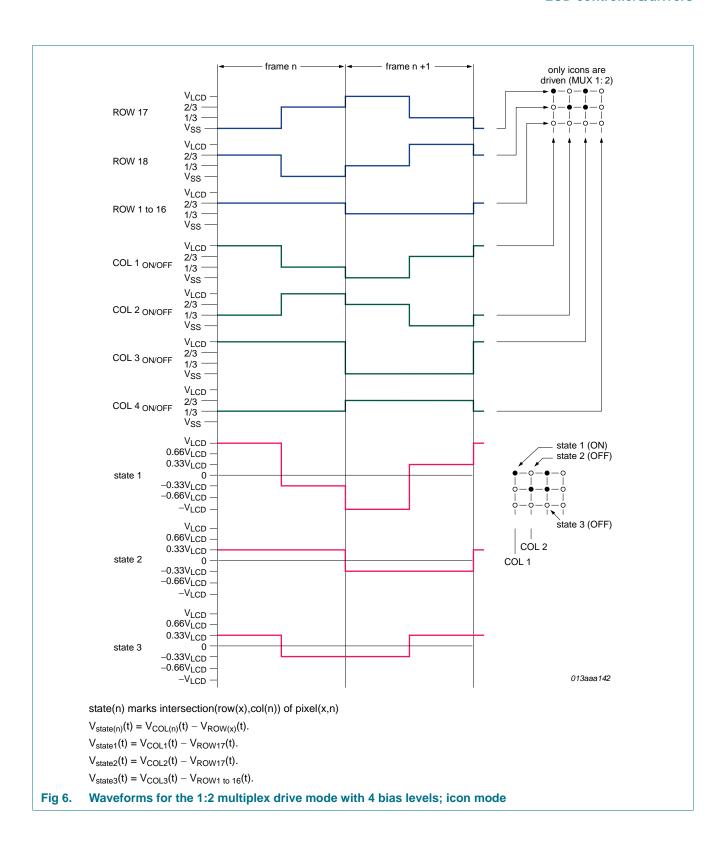

The PCF2119x contains 18 row and 80 column drivers, which drive the appropriate LCD bias voltages in sequence to the display in accordance with the data to be displayed. R17 and R18 drive the icon rows. Unused outputs should be left open.

The bias voltages and the timing are selected automatically when the number of lines in the display is selected. Figure 4 to Figure 6 show typical waveforms.

The waveforms used to drive LC displays inherently produce a DC voltage across the display cell. The PCF2119x compensates for the DC voltage by inverting the waveforms on alternate frames (called frame inversion mode or driving scheme A).

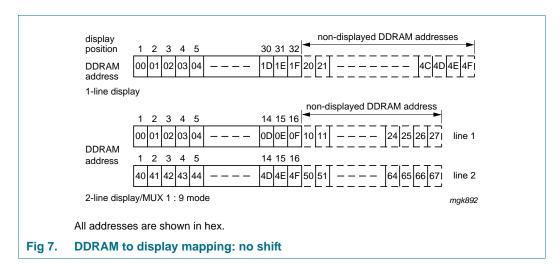

LCD controllers/drivers

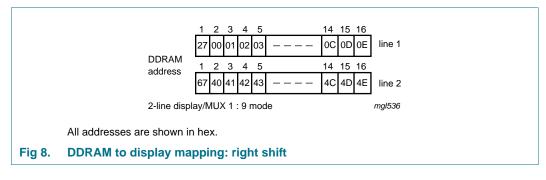

# 9. Display data RAM and ROM

#### 9.1 DDRAM

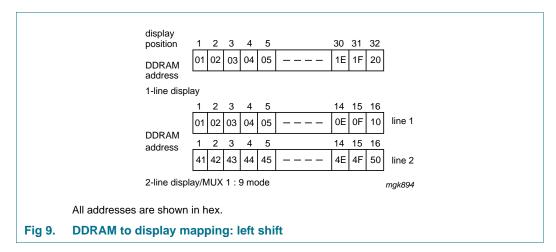

The Display Data RAM (DDRAM) stores up to 80 characters of display data represented by 8-bit character codes. RAM locations which are not used for storing display data can be used as general purpose RAM.

The basic RAM to display addressing scheme is shown in <u>Figure 7</u>, <u>Figure 8</u> and <u>Figure 9</u>. With no display shift the characters represented by the codes in the first 32 RAM locations starting at address 00h are displayed in line 1.

LCD controllers/drivers

When data is written to or read from the DDRAM, wrap-around occurs from the end of one line to the start of the next line. When the display is shifted each line wraps around within itself, independently of the others. Thus all lines are shifted and wrapped around together. The address ranges and wrap-around operations for the various modes are shown in Table 8.

Table 8. Address space and wrap-around operation

| Mode  | 1 × 32     | 2 × 16                    | 1 × 16     |
|---|------------|---------------------------|------------|
| Address space                                 | 00h to 4Fh | 00h to 27h;<br>40h to 67h | 00h to 27h |
| Read/write wrap-around (moves to next line)   | 4Fh to 00h | 27h to 40h;<br>67h to 00h | 27h to 00h |
| Display shift wrap-around (stays within line) | 4Fh to 00h | 27h to 00h;<br>67h to 40h | 27h to 00h |

#### 9.2 CGROM

The Character Generator ROM (CGROM) contains 240 character patterns in a  $5 \times 8$  dot format from 8-bit character codes. <u>Figure 10</u> to <u>Figure 15</u> show the character sets that are currently implemented.

# LCD controllers/drivers

#### 9.3 CGRAM

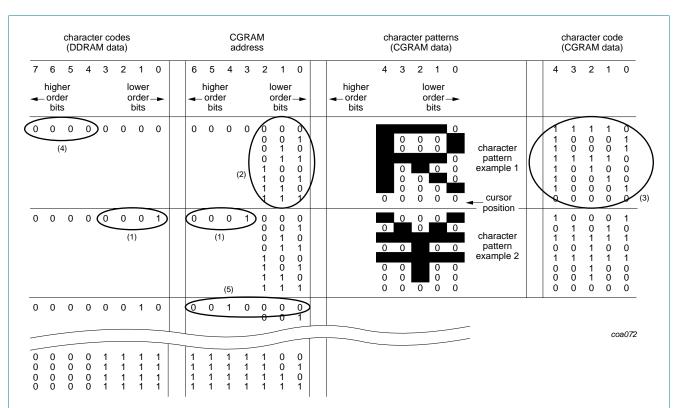

Up to 16 user defined characters may be stored in the Character Generator RAM (CGRAM). Some CGRAM characters (see Figure 22) are also used to drive icons:

- 8 CGRAM characters if icons blink and both icon rows are used in the application
- 4 CGRAM characters if no icons blink but both icon rows are used in the application
- 0 CGRAM characters if no icons are driven by the icon rows

When the icons blink option is enabled, double the number of CGRAM characters are used since both the on and off state of an icon is defined.

The CGROM and CGRAM use a common address space, of which the first column is reserved for the CGRAM (see <u>Figure 10</u> to <u>Figure 15</u>). An example of a user defined character is given in <u>Section 16.14 on page 69</u>.

Figure 16 shows the addressing principle for the CGRAM.

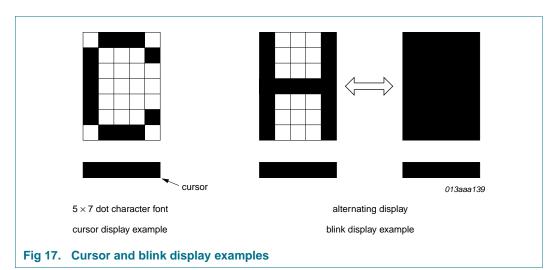

- (1) Character code bit 0 to bit 3 correspond to CGRAM address bit 3 to bit 6.
- (2) CGRAM address bit 0 to bit 2 designate the character pattern line position. The 8th line is the cursor position and display is performed by logical OR with the cursor. Data in the 8th line will appear in the cursor position. Lines are numbered from 0 to 7.
- (3) Character pattern column positions correspond to CGRAM data bit 0 to bit 4, as shown in Figure 10 to Figure 15.
- (4) As shown in <u>Figure 10</u> to <u>Figure 15</u>, CGRAM character patterns are selected when character code bit 4 to bit 7 are all logic 0. CGRAM data = logic 1 corresponds to selection for display.
- (5) Only bit 0 to bit 5 of the CGRAM address are set by the Set\_CGRAM command. Bit 6 can be set using the Set\_DDRAM command in the valid address range or by using the auto-increment feature during CGRAM write. All bits from bit 0 to bit 6 can be read using the BF\_AC instruction.

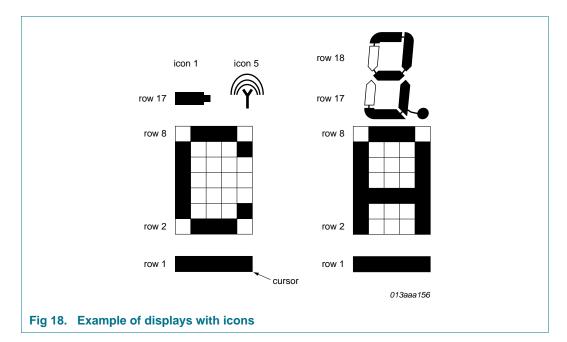

Fig 16. Relationship between CGRAM addresses, data and display patterns

#### LCD controllers/drivers

# 9.4 Cursor control circuit

The cursor control circuit generates the cursor underline and/or cursor blink as shown in Figure 17 at the DDRAM address contained in the address counter.

LCD controllers/drivers

# 10. Registers

The PCF2119x has two 8-bit registers, an instruction register and a data register. Only these two registers can be directly controlled by the microcontroller. Before an internal operation, the control information is stored temporarily in these registers, to allow interfacing to various types of microcontrollers which operate at different speeds or to allow interface to peripheral control ICs.

The instruction set for the parallel interface is shown in <u>Table 12</u> together with their execution time. Details about the parallel interface can be found in <u>Section 11.1</u>. Examples of operations on a 4-bit bus are given in <u>Table 40</u>, on a 8-bit bus in <u>Table 41</u>, <u>Table 42</u> and <u>Table 43</u>.

When using the I<sup>2</sup>C-bus, the instruction has to be commenced with a control byte as shown in <u>Table 9</u>. Details about the I<sup>2</sup>C-bus interface can be found in <u>Section 11.2</u>. An example of operations on the I<sup>2</sup>C-bus is given in <u>Table 44</u>.

Table 9. Instruction set for I<sup>2</sup>C-bus commands

| Con | trol by | yte |   |   |   |   |   | Com | mand | byte |     |     |     |     |     | I <sup>2</sup> C-bus<br>command |
|-----|---------|-----|---|---|---|---|---|-----|------|------|-----|-----|-----|-----|-----|---------------------------------|
| CO  | RS      | 0   | 0 | 0 | 0 | 0 | 0 | DB7 | DB6  | DB5  | DB4 | DB3 | DB2 | DB1 | DB0 | [1]                             |

<sup>[1]</sup>  $R/\overline{W}$  is set together with the slave address (see Table 34).

Table 10. Control byte bit description

| Bit    | Symbol | Value | Description                                     |
|--------|--------|-------|---|
| 7      | CO     | 0     | last control byte                               |
|        |        | 1     | another control byte follows after data/command |
| 6      | RS     | 0     | instruction register selected                   |
|        |        | 1     | data register selected                          |
| 5 to 0 | -      | 0     | default logic 0                                 |

Instructions are of 4 types, those that:

- 1. Designate PCF2119x functions like display format, data length, etc.
- 2. Set internal RAM addresses
- 3. Perform data transfer with internal RAM
- 4. Others, like read 'busy flag' and read 'address counter'

In normal use, type 3 instructions are used most frequently. However, automatic incrementing by 1 (or decrementing by 1) of internal RAM addresses after each data write lessens the microcontroller program load. The display shift in particular can be performed concurrently with display data write, enabling the designer to develop systems in minimum time with maximum programming efficiency.

During internal operation, no instructions other than the BF\_AC instruction will be executed. Because the busy flag is set to logic 1 while an instruction is being executed, check to ensure it is logic 0 before sending the next instruction or wait for the maximum instruction execution time, as given in <a href="Table 12">Table 12</a>. An instruction sent while the busy flag is logic 1 will not be executed.

LCD controllers/drivers

The RS bit determines which register will be accessed and the  $R/\overline{W}$  bit indicates if it is a read or a write operation (see Table 11).

Table 11. Register access selection

| Symbol | Value | Description             |
|--------|-------|-------------------------|
| RS     |       | register select         |
|        | 0     | instruction register[1] |
|        | 1     | data register[2]        |
| R/W    |       | read/write              |
|        | 0     | write operation         |
|        | 1     | read operation          |

<sup>[1]</sup> There is only write access to the instruction register, but read access to the busy flag (BF) and the address counter (AC) of the BF\_AC instruction (see Section 10.2.1.2).

Details of the instructions are explained in subsequent sections.

### 10.1 Data register

The data register temporarily stores data to be read from the DDRAM and CGRAM. Prior to being read by the Read\_data instruction, data from the DDRAM or CGRAM, corresponding to the address in the instruction register, is written to the data register.

# 10.2 Instruction register

The instruction register stores instruction codes such as Clear\_display, Curs\_disp\_shift, and address information for the Display Data RAM (DDRAM) and Character Generator RAM (CGRAM). The instruction register can be written to but not read from by the system controller.

The instruction register is sectioned into basic, standard and extended instructions. Bit H = 1 of the Function\_set instruction (see <u>Section 10.2.1.1</u>) sets the chip into extended instruction set mode.

<sup>[2]</sup> Write and read access.

Table 12. Instruction register overview

| Instruction                 | Bits    | <u>1]</u> |      |       |      |      |    |    |     |     | Required                       | Reference        |
|-----------------------------|---------|-----------|------|-------|------|------|----|----|-----|-----|--------------------------------|------------------|

<sup>[1]</sup> The bits 0 to 7 correspond with the data bus lines DB0 to DB7.

<sup>[2]</sup> fosc cycles.

<sup>[3]</sup> No operation.

<sup>[4]</sup> Do not use.

#### LCD controllers/drivers

## 10.2.1 Basic instructions (bit H = 0 or 1)

#### 10.2.1.1 Function set

Table 13. Function\_set bit description

| Bit    | Symbol | Value     | Description   |
|--------|--------|-----------|---|
| DIL    | Symbol | value     | Description   |
| RS     | -      | 0         | see <u>Table 11</u>   |
| R/W    | -      | 0         |   |
| 7 to 5 | -      | 001       | fixed value   |
| 4      | DL     |           | interface data length (for parallel mode only)                              |
|        |        | 1 0       | 2 × 4 bits (DB7 to DB4)   |
|        |        | 1 [3      | 8 bits (DB7 to DB0)   |
| 3      | -      | 0         | unused  |
| 2      | М      | <u>[3</u> | number of display lines   |
|        |        | 0         | 1 line × 32 characters  |
|        |        | 1 [4      | 2 line × 16 characters  |
| 1      | SL     |           | multiplex mode  |
|        |        | 0         | 1:18 multiplex drive mode, 1 $\times$ 32 or 2 $\times$ 16 character display |
|        |        | 1 [4][5   | 1:9 multiplex drive mode, $1 \times 16$ character display                   |
| 0      | Н      |           | instruction set control   |
|        |        | 0         | basic instruction set plus standard instruction set                         |
|        |        | 1 [4      | basic instruction set plus extended instruction set                         |
|        |        |           |   |

<sup>[1]</sup> When 4-bit width is selected, data is transmitted in two cycles using the parallel-bus. In a 4-bit application ports DB3 to DB0 should be left open-circuit (internal pull-ups).

#### 10.2.1.2 BF AC instructions

Table 14. BF\_AC bit

| Bit    | Symbol | Value                   | Description  |
|--------|--------|-------------------------|--|
| RS     | -      | 0                       | see Table 11   |
| R/W    | -      | 1                       |  |
| 7      | BF     |                         | [1] read busy flag   |
|        |        | 0                       | next instruction will be executed  |
|        |        | 1                       | internal operation is in progress;<br>next instruction will not be executed until BF = 0 |
| 6 to 0 | AC     | 000 0000 to<br>111 1111 | read address counter   |

<sup>[1]</sup> It is recommended that the BF status is checked before the next write operation is started.

<sup>[2]</sup> Default value after power-on in I<sup>2</sup>C-bus mode.

<sup>[3]</sup> No impact if SL = 1.

<sup>[4]</sup> Due to the internal pull-ups on DB3 to DB0 in a 4-bit application, the first Function\_set after power-on sets bits M, SL and H to logic 1. A second Function\_set must be sent to set bits M, SL and H to the required values.

<sup>[5]</sup> Independent of bit M and bit L of the Screen\_conf instruction (see Section 10.2.3.1). Only row 1 to row 8 and row 17 are used. All other rows must be left open-circuit. The DDRAM map is the same as in the 2 × 16 character display mode, however, the second line cannot be displayed.

LCD controllers/drivers

**Busy flag:** The busy flag indicates the internal status of the PCF2119x. A logic 1 indicates that the chip is busy and further instructions will not be accepted. The busy flag is output to pin DB7 when bit RS = 0 and bit  $R/\overline{W} = 1$ . Instructions should only be started after checking that the busy flag is at logic 0 or after waiting for the required number of cycles.

**Address counter:** The address counter is used by both CGRAM and DDRAM, and its value is determined by the previous Set\_CGRAM and Set\_DDRAM instruction. After a read/write operation the address counter is automatically incremented or decremented by  $\underline{1}$ . The address counter value is output to the bus (DB6 to DB0) when bit RS = 0 and bit  $R/\overline{W} = 1$ .

#### 10.2.1.3 Read\_data

Table 15. Read\_data bit description

| Bit    | Symbol    | Value                    | Description                   |
|--------|-----------|--------------------------|-------------------------------|
| RS     | -         | 1                        | see Table 11                  |
| R/W    | -         | 1                        |                               |
| 7 to 0 | READ_DATA | 0000 0000 to<br>11111111 | read data from CGRAM or DDRAM |

Read\_data from CGRAM or DDRAM: Read\_data reads binary 8-bit data from the CGRAM or DDRAM. The most recent 'set address' command (Set\_CGRAM or Set\_DDRAM) determines whether the CGRAM or DDRAM is to be read.

The Read\_data instruction gates the content of the data register to the bus while pin E is HIGH. After pin E goes LOW again, internal operation increments (or decrements) the address counter and stores RAM data corresponding to the new address counter into the data register.

There are only three instructions that update the data register:

- Set\_CGRAM
- Set DDRAM
- Read\_data from CGRAM or DDRAM

Other instructions (e.g. Write\_data, Curs\_disp\_shift, Clear\_display and Return\_home) do not modify the value of the data register.

#### 10.2.1.4 Write\_data

Table 16. Write\_data bit description

| Bit              | Symbol     | Value                    | Description                  |
|------------------|------------|--------------------------|------------------------------|
| RS               | -          | 1                        | see <u>Table 11</u>          |
| $R/\overline{W}$ | -          | 0                        |                              |
| 7 to 0           | WRITE_DATA | 0000 0000 to<br>11111111 | write data to CGRAM or DDRAM |

Write\_data to CGRAM or DDRAM: Write\_data writes binary 8-bit data to the CGRAM or the DDRAM.

LCD controllers/drivers

The previous Set\_CGRAM or Set\_DDRAM command determines if data is written into CGRAM or DDRAM. After writing, the address counter automatically increments or decrements by 1, in accordance with the Entry\_mode\_set (see <a href="Section 10.2.2.3">Section 10.2.2.3</a>). Only bit 4 to bit 0 of CGRAM data are valid, bit 7 to bit 5 are 'don't care'.

### 10.2.2 Standard instructions (bit H = 0)

#### 10.2.2.1 Clear\_display

Table 17. Clear\_display bit description

| Bit    | Symbol | Value    | Description  |
|--------|--------|----------|--------------|
| RS     | -      | 0        | see Table 11 |
| R/W    | -      | 0        |              |
| 7 to 0 | -      | 00000001 | fixed value  |

**Clear\_display:** writes usually the character code 20h (blank pattern) into all DDRAM addresses except for the character set 'R' where the character code 20h is not a blank pattern.

When using character set 'R', the following alternative instruction set has to be used:

- 1. Switch display off (Display\_ctl, bit D = 0).
- 2. Write a blank pattern into all DDRAM addresses (Write\_data).
- 3. Switch display on (Display\_ctl, bit D = 1).

In addition Clear\_display

- sets the DDRAM address counter to logic 0
- returns the display to its original position, if it was shifted. Thus, the display disappears and the cursor or blink position goes to the left edge of the display
- sets entry mode bit I\_D = 1 (increment mode); bit S of entry mode does not change

The instruction Clear\_display requires extra execution time. This may be allowed by checking the busy flag bit BF or by waiting until the 165 clock cycles have elapsed. The latter must be applied where no read-back options are foreseen, as in some Chip-On-Glass (COG) applications.

#### 10.2.2.2 Return home

Table 18. Return\_home bit description

| Bit    | Symbol | Value    | Description         |
|--------|--------|----------|---------------------|
| RS     | -      | 0        | see <u>Table 11</u> |
| R/W    | -      | 0        |                     |
| 7 to 0 | -      | 00000010 | fixed value         |

**Return\_home:** Sets the DDRAM address counter to logic 0 and switches a shifted display back to an unshifted state. The DDRAM content remain unchanged. The cursor or blink position goes to the left of the first display line. Bit I\_D and bit S of the Entry\_mode\_set instruction remain unchanged.

LCD controllers/drivers

### 10.2.2.3 Entry\_mode\_set

Table 19. Entry\_mode\_set bit description

| Bit    | Symbol | Value  | Description   |
|--------|--------|--------|---|
| RS     | -      | 0      | see <u>Table 11</u>   |
| R/W    | -      | 0      |   |
| 7 to 2 | -      | 000001 | fixed value   |
| 1      | I_D    |        | address increment or decrement                                    |
|        |        | 0      | DDRAM or CGRAM address decrements by 1, cursor moves to the left  |
|        |        | 1      | DDRAM or CGRAM address increments by 1, cursor moves to the right |
| 0      | S      |        | shift display to the left or right                                |
|        |        | 0      | display does not shift  |
|        |        | 1      | display shifts  |

**Bit I\_D:** When bit  $I_D = 1$  the DDRAM or CGRAM address increments by 1 when data is written into or read from the DDRAM or CGRAM. The cursor or blink position moves to the right.

When bit  $I_D = 0$  the DDRAM or CGRAM address decrements by 1 when data is written into or read from the DDRAM or CGRAM. The cursor or blink position moves to the left.

The cursor underline and cursor character blink are inhibited when the CGRAM is accessed.

**Bit S:** When bit S = 0, the display does not shift.

During DDRAM write, when bit S = 1 and bit  $I_D = 0$ , the entire display shifts to the right; when bit S = 1 and bit  $I_D = 1$ , the entire display shifts to the left.

Thus it appears as if the cursor stands still and the display moves. The display does not shift when reading from the DDRAM, or when writing to or reading from the CGRAM.

#### 10.2.2.4 Display\_ctl instructions

Table 20. Display\_ctl bit description

| Bit              | Symbol | Value | Description                                |
|------------------|--------|-------|--|
| RS               | -      | 0     | see <u>Table 11</u>                        |
| $R/\overline{W}$ | -      | 0     |  |
| 7 to 3           | -      | 00001 | fixed value                                |
| 2                | D      |       | display on or off                          |
|                  |        | 0     | display is off; chip is in power-down mode |
|                  |        | 1     | display is on                              |
| 1                | С      |       | cursor on or off                           |
|                  |        | 0     | cursor is off                              |
|                  |        | 1     | cursor is on                               |
| 0                | В      |       | character blink on or off                  |
|                  |        | 0     | character blink is off                     |
|                  |        | 1     | character blink is on                      |

PCF2119X

All information provided in this document is subject to legal disclaimers.

LCD controllers/drivers

**Bit D:** The display is on when bit D = 1 and off when bit D = 0. Display data in the DDRAM is not affected and can be displayed immediately by setting bit D = 1.

When the display is off (bit D = 0) the chip is in partial power-down mode:

- The LCD outputs are connected to V<sub>SS</sub>
- The V<sub>LCD</sub> generator and bias generator are turned off

Three oscillator cycles are required after sending the 'display off' instruction to ensure all outputs are at  $V_{SS}$ , afterwards the oscillator can be stopped. If the oscillator is running during partial power-down mode ('display off') the chip can still execute instructions. Even lower current consumption is obtained by inhibiting the oscillator (pin OSC to  $V_{SS}$ ).

To ensure  $I_{DD}$  < 1  $\mu$ A:

- the parallel bus ports DB7 to DB0 should be connected to V<sub>DD</sub>
- pins RS and R/W should be connected to V<sub>DD</sub> or left open-circuit
- pin PD should be connected to V<sub>DD</sub>

Recovery from power-down mode:

- pin PD should be connected back to V<sub>SS</sub>
- if necessary pin OSC should be connected back to V<sub>DD</sub>
- a Display\_ctl instruction with bit D = 1 should be sent

**Bit C:** The cursor is displayed when bit C = 1 and inhibited when bit C = 0. Even if the cursor disappears, bit  $I_D$  and bit S (see Section 10.2.2.3) remain in operation during display data write. The cursor is displayed using 5 dots in the 8th line (see Figure 17).

**Bit B:** The character, indicated by the cursor, blinks when bit B = 1. The character blink is displayed by switching between display characters and all dots on with a period of

approximately 1 second, with 
$$f_{blink} = \frac{f_{osc}}{52224}$$

#### 10.2.2.5 Curs\_disp\_shift

Table 21. Curs\_disp\_shift bit description

| Bit    | Symbol | Value | Description                        |
|--------|--------|-------|------------------------------------|
| RS     | -      | 0     | see <u>Table 11</u>                |
| R/W    | -      | 0     |                                    |
| 7 to 4 | -      | 0001  | fixed value                        |
| 3      | SC     |       | cursor move or display shift       |
|        |        | 0     | move cursor                        |
|        |        | 1     | shift display                      |
| 2      | RL     |       | shift or move to the right or left |
|        |        | 0     | left shift or move                 |
|        |        | 1     | right shift or move                |
| 1 to 0 | -      | 00    | fixed value                        |

LCD controllers/drivers

**Bits SC and RL:** Curs\_disp\_shift moves the cursor position or the display to the right or left without writing or reading display data. This function is used to correct a character or move the cursor through the display.

In 2-line displays, the cursor moves to the next line when it passes the last position (40) of the line. When the displayed data is shifted repeatedly all lines shift at the same time; displayed characters do not shift into the next line.

The address counter content does not change if the only action performed is shift display (SC = 1) but increments or decrements with the shift cursor (SC = 0).

#### 10.2.2.6 Set CGRAM

Table 22. Set\_CGRAM bit description

| Bit              | Symbol | Value               | Description       |
|------------------|--------|---------------------|-------------------|
| RS               | -      | 0                   | see Table 11      |
| $R/\overline{W}$ | -      | 0                   |                   |
| 7 to 6           | -      | 01                  | fixed value       |
| 5 to 0           | ACG    | 000000 to<br>111111 | set CGRAM address |

**Set\_CGRAM:** Sets the CGRAM address bits ACG[5:0] into the address counter. Data can then be written to or read from the CGRAM.

**Remark:** The CGRAM address uses the same address register as the DDRAM address. This register consists of 7 bits. But with the Set\_CGRAM command, only bit 5 to bit 0 are set. Bit 6 can be set using the Set\_DDRAM command first, or by using the auto-increment feature during CGRAM write. All bits 6 to 0 can be read using the BF\_AC instruction.

When writing to the lower part of the CGRAM, ensure that bit 6 of the address is not set (e.g. by an earlier DDRAM write).

#### 10.2.2.7 Set DDRAM

Table 23. Set\_DDRAM bit description

| Bit    | Symbol | Value                 | Description       |
|--------|--------|-----------------------|-------------------|
| RS     | -      | 0                     | see Table 11      |
| R/W    | -      | 0                     |                   |
| 7      | -      | 1                     | fixed value       |
| 6 to 0 | ADD    | 0000000 to<br>1111111 | set DDRAM address |

**Set\_DDRAM:** Sets the DDRAM address bits ADD[6:0] into the address counter. Data can then be written to or read from the DDRAM.

#### LCD controllers/drivers

## 10.2.3 Extended instructions (bit H = 1)

#### 10.2.3.1 Screen conf

Table 24. Screen\_conf bit description

| Bit              | Symbol | Value   | Description                      |
|------------------|--------|---------|----------------------------------|
| RS               | -      | 0       | see Table 11                     |
| $R/\overline{W}$ | -      | 0       |                                  |
| 7 to 1           | -      | 0000001 | fixed value                      |
| 0                | L      |         | screen configuration             |
|                  |        | 0       | split screen standard connection |
|                  |        | 1       | split screen mirrored connection |

#### Screen\_conf:

- If bit L = 0, then the two halves of a split screen are connected in a standard way i.e. column 1/81, 2/82 to 80/160.
- If bit L = 1, then the two halves of a split screen are connected in a mirrored way i.e. column 1/160, 2/159 to 80/81. This allows single layer PCB or glass layout.

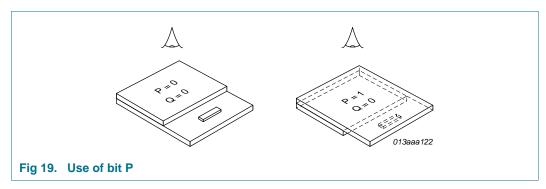

### 10.2.3.2 Disp\_conf

Table 25. Disp\_conf bit description

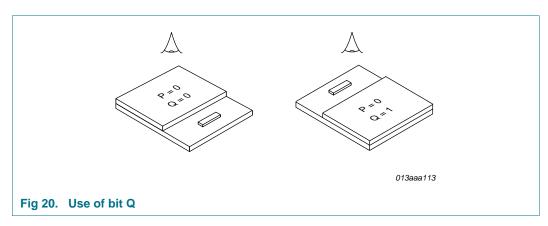

| Bit    | Symbol | Value  | Description  |
|--------|--------|--------|--|
| RS     | -      | 0      | see <u>Table 11</u>  |
| R/W    | -      | 0      |  |
| 7 to 2 | -      | 000001 | fixed value  |
| 1      | Р      |        | display column configuration   |
|        |        | 0      | column data: left to right;  |
|        |        |        | column data is displayed from column 1 to column 80  |
|        |        | 1      | column data: right to left;  |
|        |        |        | column data is displayed from column 80 to column 1  |
| 0      | Q      |        | display row configuration  |
|        |        | 0      | row data: top to bottom;   |
|        |        |        | row data is displayed from row 1 to row 16 and icon row data in row 17 and row 18                  |
|        |        |        | in single line mode (SL = 1) row data is displayed from row 1 to row 8 and icon row data in row 17 |
|        |        | 1      | row data: bottom to top;   |
|        |        |        | row data is displayed from row 16 to row 1 and icon row data in row 18 and row 17                  |
|        |        |        | in single line mode (SL = 1) row data is displayed from row 8 to row 1 and icon row data in row 17 |

**Bit P:** The P bit is used to flip the display left to right by mirroring the column data, as shown in <u>Figure 19</u>. This allows the display to be viewed from behind instead of front and enhances the flexibility in the assembly of equipment and avoids complicated data manipulation within the controller.

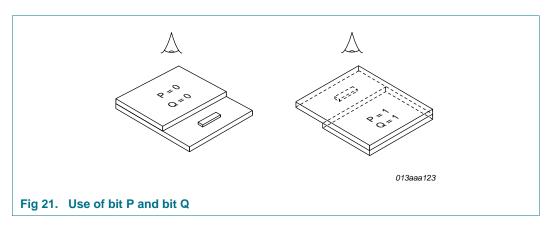

LCD controllers/drivers

**Bit Q:** The Q bit flips the display top to bottom by mirroring the row data, as shown in Figure 20.

**Combination of bit P and bit Q:** A combination of P and Q allows the display to be rotated horizontally and vertically by 180 degree, as shown in <u>Figure 21</u>. This is useful for viewing the display from the opposite edge.

LCD controllers/drivers

#### 10.2.3.3 | lcon\_ctl

Table 26. Icon ctl bit description

| Bit    | Symbol | Value | Description                     |
|--------|--------|-------|---------------------------------|
| RS     | -      | 0     | see Table 11                    |
| R/W    | -      | 0     |                                 |
| 7 to 3 | -      | 00001 | fixed value                     |
| 2      | IM     |       | icon mode                       |
|        |        | 0     | character mode, full display    |
|        |        | 1     | icon mode, only icons displayed |
| 1      | IB     |       | icon blink                      |
|        |        | 0     | icon blink disabled             |
|        |        | 1     | icon blink enabled              |
| 0      | DM     |       | direct mode                     |
|        |        | 0     | off                             |
|        |        | 1     | on                              |

The PCF2119x can drive up to 160 icons. See <u>Figure 22</u> and <u>Figure 23</u> for CGRAM to icon mapping.

**Bit IM:** When bit IM = 0, the chip is in character mode. In the character mode characters and icons are driven (multiplex drive mode 1:18 or 1:9). The  $V_{LCD}$  generator, if used, produces the  $V_{LCDOUT}$  voltage programmed with register  $V_A$ .

When bit IM = 1, the chip is in icon mode. In the icon mode only the icons are driven (multiplex drive mode 1:2). The  $V_{LCD}$  generator, if used, produces the  $V_{LCDOUT}$  voltage as programmed with register  $V_B$ .

Table 27. Normal/icon mode operation

| Bit IM | Mode           | V <sub>LCDOUT</sub>           |
|--------|----------------|-------------------------------|
| 0      | character mode | generated from V <sub>A</sub> |
| 1      | icon mode      | generated from V <sub>B</sub> |

Bit IB: Icon blink control is independent of the cursor/character blink function.

When bit IB = 0, the icon blink is disabled. Icon data is stored in CGRAM character 0 to 3  $(4 \times 8 \times 5 = 160 \text{ bits for } 160 \text{ icons}).$ 

When bit IB = 1, the icon blink is enabled. In this case each icon is controlled by two bits. Blink consists of two half phases (corresponding to the cursor on and off phases called even and odd phases hereafter).

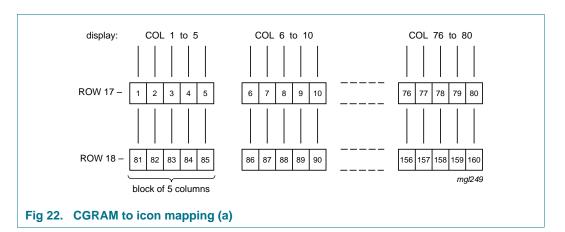

Icon states for the even phase are stored in CGRAM characters 0 to 3  $(4 \times 8 \times 5 = 160 \text{ bits for } 160 \text{ icons})$ . These bits also define icon state when icon blink is not used (see <u>Table 28</u>).

Icon states for the odd phase are stored in CGRAM character 4 to 7 (another 160 bits for the 160 icons). When icon blink is disabled CGRAM characters 4 to 7 may be used as normal CGRAM characters.

LCD controllers/drivers

Table 28. Blink effect for icons and cursor character blink

| Parameter              | Even phase                      | Odd phase                       |
|------------------------|---------------------------------|---------------------------------|
| cursor character blink | block (all on)                  | normal (display character)      |
| icons                  | state 1; CGRAM character 0 to 3 | state 2; CGRAM character 4 to 7 |

| icon no. | phase       | ROW/COL  |    |   | cha | racte | er c | ode | 3 |     |             | CC | RA | Ма | ddre | ess |     | C            | CGR | RAM | dat | а   | icon view |
|----------|-------------|----------|----|---|-----|-------|------|-----|---|-----|-------------|----|----|----|------|-----|-----|--------------|-----|-----|-----|-----|-----------|
|          |             |          | 7  | - | 5   | 4     | 3    | 2   | 1 | 0   | 6           | 5  | 4  | 3  | 2    | 1   | 0   | 4            | 3   | 2   | 1   | 0   |           |
|          |             |          | MS | В |     |       |      |     |   | LSB | MS          | 3  |    |    |      |     | LSB | MSE          | 3   |     |     | LSB |           |
| 1-5      | even        | 17/1-5   | 0  | 0 | 0   | 0     | 0    | 0   | 0 | 0   | 0           | 0  | 0  | 0  | 0    | 0   | 0   | 1            | 0   | 1   | 0   | 1   |           |

| 11-15    | even        | 17/11-15 | 0  | 0 | 0   | 0     | 0    | 0   | 0 | 0   | 0           | 0  | 0  | 0  | 0    | 1   | 0   | 0            | 1   | 1   | 1   | 0   |           |
| 1        | 1           |          |    |   |     |       | l    |     |   |     | !<br>!      |    |    | I  |      |     |     | !<br>!       |     | ı   |     |     | 1         |
| 76-80    | even        | 17/76-80 | 0  | 0 | 0   | 0     | 0    | 0   | 0 | 1   | 0           | 0  | 0  | 1  | 1    | 1   | 1   | 1            | 1   | 1   | 1   | 1   |           |
| 81-85    | even        | 18/1-5   | 0  | 0 | 0   | 0     | 0    | 0   | 1 | 0   | 0           | 0  | 1  | 0  | 0    | 0   | 0   | 1            | 1   | 0   | 0   | 0   |           |
| 1        | 1           |          |    |   |     |       | I    |     |   |     | !<br>!      |    |    | ı  |      |     |     | <br> -<br> - |     | I   |     |     | 1         |
| 156-160  | even        | 18/76-80 | 0  | 0 | 0   | 0     | 0    | 0   | 1 | 1   | 0           | 0  | 1  | 1  | 1    | 1   | 1   | 1            | 1   | 1   | 0   | 1   |           |
| 1-5      | odd (blink) | 17/1-5   | 0  | 0 | 0   | 0     | 0    | 1   | 0 | 0   | 0           | 1  | 0  | 0  | 0    | 0   | 0   | 0            | 0   | 0   | 0   | 0   |           |
|          |             |          |    |   |     |       | I    |     |   |     | !<br>!<br>! |    |    | I  |      |     |     |              |     | I   |     |     | 1         |
| 156-160  | odd (blink) | 18/76-80 | 0  | 0 | 0   | 0     | 0    | 1   | 1 | 1   | 0           | 1  | 1  | 1  | 1    | 1   | 1   | 0            | 0   | 1   | 1   | 0   |           |
|          |             |          | •  |   |     |       |      |     |   |     | -           |    |    |    |      |     |     |              |     |     |     |     | mgk999    |

CGRAM data: logic 1 of a data bit turns the icon on and logic 0 turns the icon off.

Character codes: bits 0 to 3 define the icon state when icon blink is disabled or during the even phase when icon blink is enabled. Bits 4 to 7 define the icon state during the odd phase when icon blink is enabled (not used for icons when icon blink is disabled)

Fig 23. CGRAM to icon mapping (b)

**Bit DM:** When DM = 0, the chip is not in the direct mode. Either the internal  $V_{LCD}$  generator or an external voltage may be used to achieve  $V_{LCD}$ .

When DM = 1, the chip is in direct mode. The internal  $V_{LCD}$  generator is turned off and the output  $V_{LCDOUT}$  is directly connected to  $V_{DD2}$  (i.e. the  $V_{LCD}$  generator supply voltage).

PCF2119X

**Remark:** In direct mode, no external  $V_{\text{LCD}}$  is possible.

The direct mode can be used to reduce the current consumption when the required output voltage  $V_{LCDOUT}$  is close to the  $V_{DD2}$  supply voltage. This can be the case in icon mode or in MUX 1:9 (depending on LCD liquid properties).

### 10.2.3.4 Temp\_ctl

Table 29. Temp\_ctl bit description

|        | • -     | •        |                         |
|--------|---------|----------|-------------------------|
| Bit    | Symbol  | Value    | Description             |
| RS     | -       | 0        | see Table 11            |
| R/W    | -       | 0        |                         |
| 7 to 2 | -       | 000100   | fixed value             |
| 1 to 0 | TC[1:0] | 00 to 11 | temperature coefficient |

The bit-field TC[1:0] selects the temperature coefficient for the internally generated  $V_{LCDOUT}$  (see <u>Table 30</u>).

Table 30. TC[1:0] selection of V<sub>LCD</sub> temperature coefficient

| TC[1:0] | Typical value | Description  |
|---------|---------------|--|
| 00      | −0.16 %/K     | V <sub>LCD</sub> temperature coefficient 0 (default value) |
| 10      | −0.18 %/K     | V <sub>LCD</sub> temperature coefficient 1                 |
| 01      | −0.21 %/K     | V <sub>LCD</sub> temperature coefficient 2                 |
| 11      | −0.24 %/K     | V <sub>LCD</sub> temperature coefficient 3                 |

### 10.2.3.5 HV\_gen

Table 31. HV\_gen bit description

| Bit    | Symbol | Value    | Description        |
|--------|--------|----------|--------------------|
| RS     | -      | 0        | see Table 11       |
| R/W    | -      | 0        |                    |
| 7 to 2 | -      | 010000   | fixed value        |
| 1 to 0 | S[1:0] | 00 to 11 | voltage multiplier |

A software configurable voltage multiplier is incorporated in the  $V_{LCD}$  generator and can be set via the HV\_gen command. The voltage multiplier control can be used to reduce current consumption by disconnecting internal voltage multiplier stages, depending on the required  $V_{LCDOUT}$  output voltage (see Table 32).

Table 32. Voltage multiplier control bits

| S[1:0] | Description  |
|--------|--|
| 00     | set $V_{LCD}$ generator stages to 1 (2 × voltage multiplier) |
| 01     | set $V_{LCD}$ generator stages to 2 (3 × voltage multiplier) |
| 10     | set $V_{LCD}$ generator stages to 3 (4 × voltage multiplier) |
| 11     | do not use   |

LCD controllers/drivers

#### 10.2.3.6 VLCD\_set

Table 33. VLCD\_set bit description

| Bit    | Symbol                           | Value                 | Description                                   |
|--------|----------------------------------|-----------------------|---|
| RS     | -                                | 0                     | see Table 11                                  |
| R/W    | -                                | 0                     |   |
| 7      | -                                | 1                     | fixed value                                   |
| 6      | V                                |                       | set register V <sub>A</sub> or V <sub>B</sub> |
|        |                                  | 0                     | set register V <sub>A</sub>                   |
|        |                                  | 1                     | set register V <sub>B</sub>                   |
| 5 to 0 | V <sub>A</sub> or V <sub>B</sub> | 00 0000 to<br>11 1111 | factor for calculating V <sub>LCD</sub>       |

The  $V_{LCD}$  value is calculated with the <u>Equation 2 on page 10</u>. The multiplication factor is programmed by instruction. Two on-chip registers ( $V_A$  and  $V_B$ ) hold the multiplication factor for the character mode and the icon mode, respectively. The generated  $V_{LCDOUT}$  value is independent of  $V_{DD}$ , allowing battery operation of the chip.

#### V<sub>x</sub> programming:

- 1. Send Function\_set instruction with bit H = 1.
- 2. Send VLCD\_set instruction to write to the voltage register:
  - a. Bit 7 = 1 and bit 6 = 0: bit 5 to bit 0 are the multiplication factor for  $V_{LCD}$  of character mode  $(V_A)$ .
  - b. Bit 7 = 1 and bit 6 = 1: bit 5 to bit 0 are the multiplication factor for  $V_{LCD}$  of icon mode  $(V_B)$ .
  - c. Bit 5 to bit 0 = 0 switches  $V_{LCD}$  generator off (when selected).
  - d. During 'display off'/power-down the  $V_{\mbox{\scriptsize LCD}}$  generator is also disabled.
- 3. Send Function\_set instruction with bit H = 0 to resume normal programming.

LCD controllers/drivers

## 11. Basic architecture

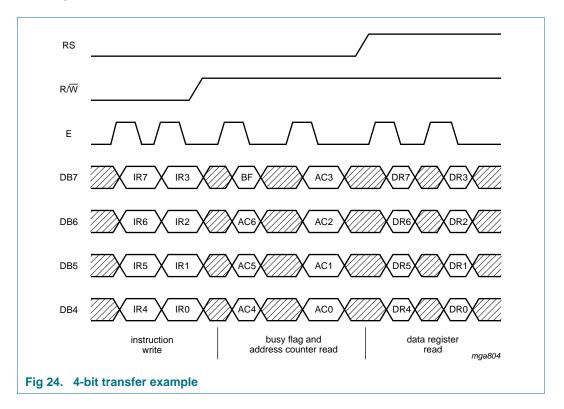

### 11.1 Parallel interface

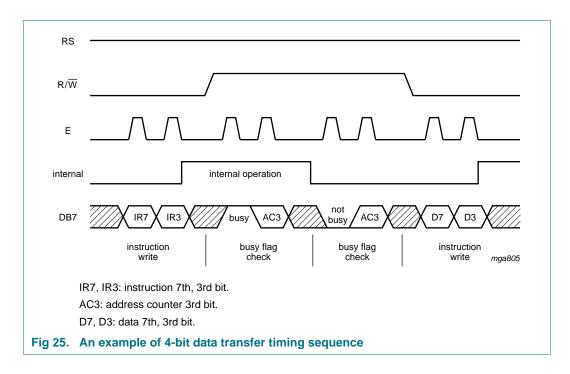

The PCF2119x can send data in either two 4-bit operations or one 8-bit operation and can thus interface to 4-bit or 8-bit microcontrollers.

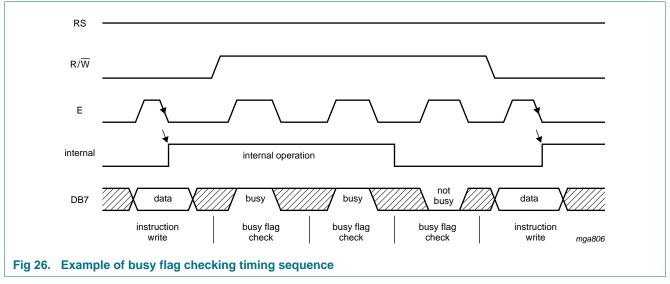

In 8-bit mode data is transferred as 8-bit bytes using the 8 ports DB7 to DB0. Three further control lines E, RS and R/W are required.

In 4-bit mode data is transferred in two cycles of 4 bits each using ports DB7 to DB4 for the transaction. The higher order bits (corresponding to range of bit 7 to bit 4 in 8-bit mode) are sent in the first cycle and the lower order bits (bit 3 to bit 0 in 8-bit mode) in the second cycle. Data transfer is complete after two 4-bit data transfers. It should be noted that two cycles are also required for the busy flag check. 4-bit operation is selected by instruction (see Figure 24 to Figure 26 for examples of bus protocol).

In 4-bit mode, ports DB3 to DB0 must be left open-circuit. They are pulled up to  $V_{\text{DD}}$  internally.

LCD controllers/drivers

### 11.2 I<sup>2</sup>C-bus interface

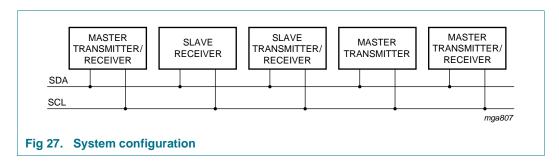

The  $I^2C$ -bus is for bidirectional, two-line communication between different ICs or modules. The two lines are the Serial DAta line (SDA) and the Serial CLock line (SCL). Both lines must be connected to a positive supply via pull-up resistors. Data transfer may be initiated only when the bus is not busy.

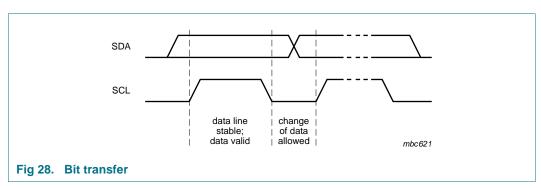

Each byte of eight bits is followed by an acknowledge bit. A slave receiver which is addressed must generate an acknowledge after the reception of each byte.

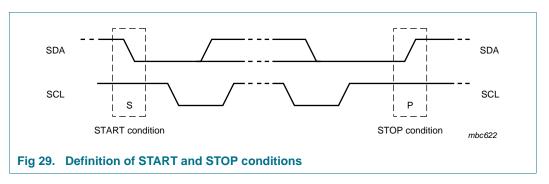

Also a master receiver must generate an acknowledge after the reception of each byte that has been clocked out of the slave transmitter.

The device that acknowledges must pull-down the SDA line during the acknowledge clock pulse, so that the SDA line is stable LOW during the HIGH period of the acknowledge related clock pulse (set-up and hold times must be taken into consideration).

A master receiver must signal an end of data to the transmitter by not generating an acknowledge bit on the last byte that has been clocked out of the slave. In this event the transmitter must leave the data line HIGH to enable the master to generate a STOP condition.

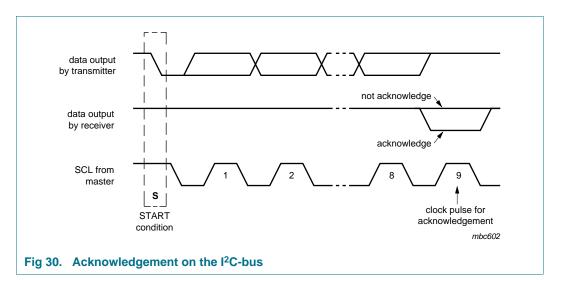

PCF2119X

LCD controllers/drivers

#### 11.2.1 I<sup>2</sup>C-bus protocol

Two I<sup>2</sup>C-bus slave addresses (0111 010 and 0111 011) are reserved for the PCF2119x.The entire I<sup>2</sup>C-bus slave address byte is shown in Table 34.

Table 34. I<sup>2</sup>C slave address byte

|     | Slave address |   |   |   |   |   |     |     |  |  |  |
|-----|---------------|---|---|---|---|---|-----|-----|--|--|--|
| Bit | 7             | 6 | 5 | 4 | 3 | 2 | 1   | 0   |  |  |  |
|     | MSB           |   |   |   |   |   |     | LSB |  |  |  |
|     | 0             | 1 | 1 | 1 | 0 | 1 | SA0 | R/W |  |  |  |

Bit 1 of the slave address byte, that a PCF2119x will respond to, is defined by the level tied to its SA0 input ( $V_{SS}$  for logic 0 and  $V_{DD}$  for logic 1).

Before any data is transmitted on the I<sup>2</sup>C-bus, the device which should respond is addressed first. The addressing is always carried out with the first byte transmitted after the START procedure.

The I<sup>2</sup>C-bus configuration for the different PCF2119x read and write cycles is shown in Figure 31 to Figure 33.

The slow down feature of the I<sup>2</sup>C-bus protocol (receiver holds SCL line LOW during internal operations) is not used in the PCF2119x.

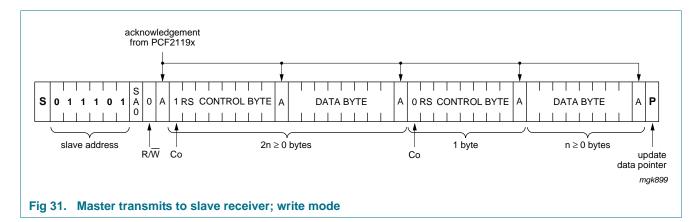

#### 11.2.2 I<sup>2</sup>C-bus definitions

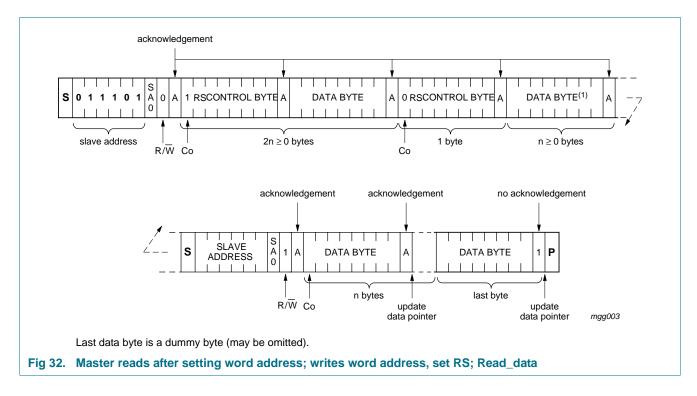

#### Definitions:

- Transmitter: the device which sends the data to the bus.
- Receiver: the device which receives the data from the bus.
- Master: the device which initiates a transfer, generates clock signals and terminates a transfer.
- Slave: the device addressed by a master.
- Multi-master: more than one master can attempt to control the bus at the same time without corrupting the message.

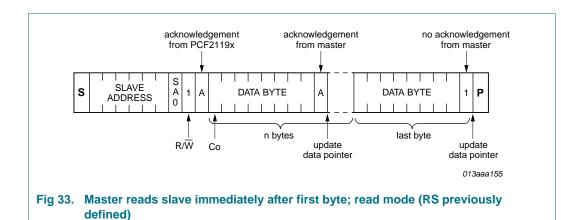

PCF2119X

- Arbitration: procedure to ensure that if more than one master simultaneously tries to control the bus, only one is allowed to do so and the message is not corrupted.
- Synchronization: procedure to synchronize the clock signals of two or more devices.

#### LCD controllers/drivers

11.3 Safety notes

#### **CAUTION**

This device is sensitive to ElectroStatic Discharge (ESD). Observe precautions for handling electrostatic sensitive devices.

Such precautions are described in the ANSI/ESD S20.20, IEC/ST 61340-5, JESD625-A or equivalent standards.

#### **CAUTION**

Static voltages across the liquid crystal display can build up when the LCD supply voltage ( $V_{LCD}$ ) is on while the IC supply voltage ( $V_{DD}$ ) is off, or vice versa. This may cause unwanted display artifacts. To avoid such artifacts,  $V_{LCD}$  and  $V_{DD}$  must be applied or removed together.

### CAUTION

Semiconductors are light sensitive. Exposure to light sources can cause the IC to malfunction. The IC must be protected against light. The protection must be applied to all sides of the IC.

<sup>[1]</sup> LCD outputs are open-circuit; inputs at  $V_{DD}$  or  $V_{SS}$ ; bus inactive.

<sup>[2]</sup>  $T_{amb} = 25 \, ^{\circ}C$ ;  $f_{osc} = 200 \, kHz$ .

<sup>[3]</sup> LCD outputs are open-circuit;  $V_{LCD}$  generator is on; load current  $I_{LCD}$  = 5  $\mu$ A.

<sup>[4]</sup> The I<sup>2</sup>C-bus interface of PCF2119x is 5 V tolerant.

Resistance of output pins (R1 to R18 and C1 to C80) with a load current of 10  $\mu$ A; outputs measured one at a time; external LCD supply  $V_{LCD} = 3 \text{ V}$ ;  $V_{DD1} = V_{DD2} = V_{DD3} = 3 \text{ V}$ .

<sup>[6]</sup> LCD outputs open-circuit; external LCD supply.

# 16. Application information

## 16.1 General application information

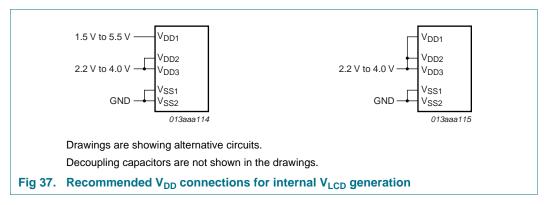

The required minimum value for the external capacitors in an application with the PCF2119x are:  $C_{ext}$  from pins  $V_{LCD}$  to  $V_{SS}$  = 100 nF and for pins  $V_{DD}$  to  $V_{SS}$  = 470 nF. Higher capacitor values are recommended for ripple reduction.

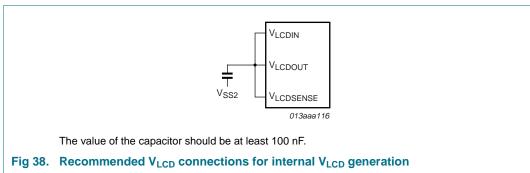

For COG applications the recommended ITO track resistance is to be minimized for the I/O and supply connections. Optimized values for these tracks are below 50  $\Omega$  for the supply and below 100  $\Omega$  for the I/O connections. Higher track resistance reduce performance and increase current consumption. To avoid accidental triggering of Power-On Reset (POR) (especially in COG applications), the supplies must be adequately decoupled. Depending on power supply quality,  $V_{DD1}$  may have to be risen above the specified minimum.

When external LCD supply voltage is supplied,  $V_{LCDOUT}$  should be left open-circuit to avoid any stray current, and  $V_{LCDIN}$  must be connected to  $V_{LCDSENSE}$ .

The PCF2119x I<sup>2</sup>C-bus interface is compatible with systems, where the I<sup>2</sup>C pull-up resistors are connected to a 5 V  $\pm$ 10 % supply.

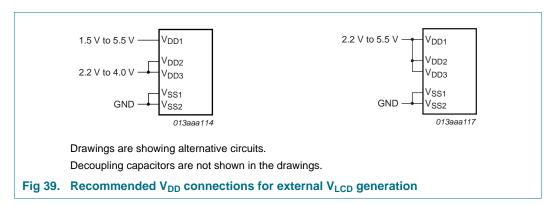

## 16.2 Power supply connections for internal V<sub>LCD</sub> generation

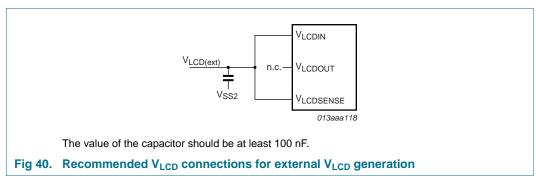

LCD controllers/drivers

## 16.3 Power supply connections for external V<sub>LCD</sub> generation

**Remark:** When using an external  $V_{LCD}$ , the internal  $V_{LCD}$  generator **must never** be switched on and direct mode must be avoided otherwise damages will occur.

## 16.4 Information about V<sub>LCD</sub> connections

**V**<sub>LCDIN</sub> — This input is used for generating the 5 LCD bias levels. It is the power supply for the bias level buffers.

 $V_{LCDOUT}$  — This is the  $V_{LCD}$  output if  $V_{LCD}$  is generated internally. In this case pin  $V_{LCDOUT}$  must be connected to  $V_{LCDIN}$  and to  $V_{LCDSENSE}$ . If  $V_{LCD}$  is generated externally,  $V_{LCDOUT}$  must be left unconnected.

 $V_{LCDSENSE}$  — This input is used for the voltage multiplier's regulation circuitry. When using the internal  $V_{LCD}$  generation, this pin must be connected to  $V_{LCDOUT}$  and  $V_{LCDIN}$ . When using an external  $V_{LCD}$  supply it must be connected to  $V_{LCDIN}$  only.

#### 16.5 Reducing current consumption

Reducing current consumption can be achieved by one of the options given in Table 39.

When  $V_{LCD}$  lies outside the  $V_{DD}$  range and must be generated, it is usually more efficient to use the on-chip  $V_{LCD}$  generator than an external regulator.

LCD controllers/drivers

Table 39. Reducing current consumption

| Original mode                        | Alternative mode            |
|--------------------------------------|-----------------------------|
| character mode                       | icon mode (control bit IM)  |
| display on                           | display off (control bit D) |
| V <sub>LCD</sub> generator operating | direct mode                 |
| any mode                             | power-down mode (pin PD)    |

## 16.6 Charge pump characteristics

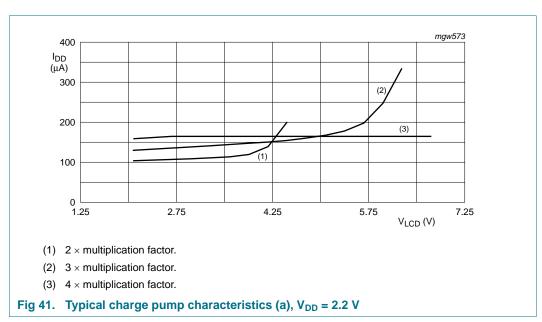

Typical graphs of the total power consumption of the PCF2119x using the internal charge pump are illustrated in Figure 41, Figure 42 and Figure 43.

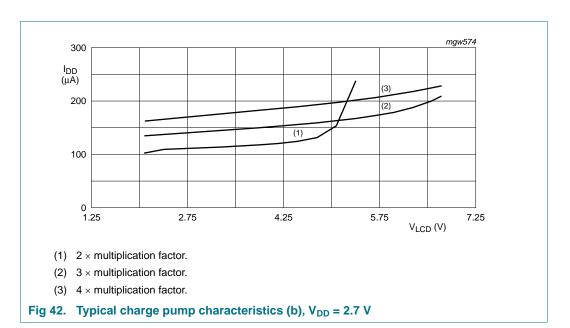

The graphs were obtained under the following conditions:

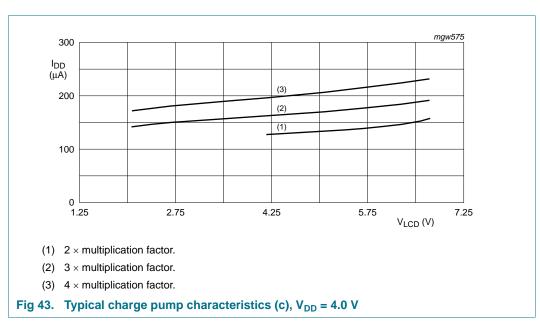

- T<sub>amb</sub> = 25 °C
- $V_{DD1} = V_{DD2} = V_{DD3} = 2.2 \text{ V (minimum)}$ , 2.7 V (typical) and 4.0 V (maximum)
- Normal mode
- f<sub>osc</sub> = internal oscillator
- multiplex drive mode 1:18
- Typical current load for I<sub>LCD</sub> = 10 μA.

For each multiplication factor there is a separate line. The line ends where it is not possible to get a higher voltage under its conditions (a higher multiplication factor is needed to get higher voltages).

Connecting different displays may result in different current consumption. This affects the efficiency and the optimum multiplication factor to be used to generate a certain output voltage.

## 16.9 4-bit operation, 1-line display using external reset

The program must set functions prior to a 4-bit operation (see <u>Table 40</u>). When power is turned on, 8-bit operation is automatically selected and the PCF2119x attempts to perform the first write as an 8-bit operation. Since nothing is connected to ports DB0 to DB3, a rewrite is then required. However, since one operation is completed in two accesses of 4-bit operation, a rewrite is required to set the functions (see <u>Table 40</u> step 3). Thus, DB4 to DB7 of the Function\_set are written twice.

Table 40. 4-bit operation, 1-line display example; using external reset (character set 'A')

| Step | Inst  | ructior | 1     |      |      |     | Display | Operation   |  |  |  |  |  |  |
|------|-------|---------|-------|------|------|-----|---------|---|--|--|--|--|--|--|
|      | RS    | R/W     | DB7   | DB6  | DB5  | DB4 |         |   |  |  |  |  |  |  |
| 1    | pow   | er supp | ly on |      |      |     | •       | initialized by the external reset; no display appears                               |  |  |  |  |  |  |
| 2    | Fund  | ction_s | et    |      |      |     |         | sets to 4-bit operation; in this instance operation is handled as                   |  |  |  |  |  |  |
|      | 0     | 0       | 0     | 0    | 1    | 0   |         | 8-bit by initialization and only this instruction completes with one write          |  |  |  |  |  |  |
| 3    | Fund  | ction_s | et    |      |      |     |         | sets to 4-bit operation, selects 1-line display and $V_{LCD} = V_0$ ;               |  |  |  |  |  |  |
|      | 0     | 0       | 0     | 0    | 1    | 0   |         | 4-bit operation starts from this point and resetting is needed                      |  |  |  |  |  |  |
|      | 0     | 0       | 0     | 0    | 0    | 0   |         |   |  |  |  |  |  |  |
| 4    | Disp  | lay_ctl |       |      |      |     |         | turns display and cursor on; entire display is blank after                          |  |  |  |  |  |  |
|      | 0     | 0       | 0     | 0    | 0    | 0   | _       | initialization  |  |  |  |  |  |  |
|      | 0     | 0       | 1     | 1    | 1    | 0   |         |   |  |  |  |  |  |  |
| 5    | Entr  | y_mod   | e_set |      |      |     |         | sets mode to increment the address by 1 and to shift the cursor                     |  |  |  |  |  |  |
|      | 0     | 0       | 0     | 0    | 0    | 0   | _       | to the right at the time of write to the DDRAM or CGRAM;                            |  |  |  |  |  |  |
|      | 0     | 0       | 0     | 1    | 1    | 0   |         | display is not shifted  |  |  |  |  |  |  |
| 6    | Write | e_data  | to CG | RAM/ | DDRA | M   | 1       | writes 'P'; the DDRAM has already been selected by                                  |  |  |  |  |  |  |
|      | 1     | 0       | 0     | 1    | 0    | 1   | P_      | initialization at power-on; the cursor is incremented by 1 and shifted to the right |  |  |  |  |  |  |
|      | 1     | 0       | 0     | 0    | 0    | 0   | 1       | Silited to the right  |  |  |  |  |  |  |

### 16.10 8-bit operation, 1-line display using external reset

Table 41 and Table 42 show an example of a 1-line display in 8-bit operation. The PCF2119x functions must be set by the Function\_set instruction prior to display. Since the DDRAM can store data for 80 characters, the RAM can be used for advertising displays when combined with display shift operation. Since the display shift operation changes display position only and the DDRAM contents remain unchanged, display data entered first can be displayed when the Return\_home operation is performed.

Table 41. 8-bit operation, 1-line display example; using external reset (character set 'A')

| Step | Instr | uction  | 1     |     |     |     |     |     |     | Display | Operation                               |   |
|------|-------|---------|-------|-----|-----|-----|-----|-----|-----|---------|---|---|
|      | RS    | R/W     | DB7   | DB6 | DB5 | DB4 | DB3 | DB2 | DB1 | DB0     |   |   |
| 1    | powe  | er supp | ly on |     |     |     |     |     |     |         |   | initialized by the external reset; no display appears |
| 2    | Func  | ction_s | et    |     |     |     |     |     |     |         | sets to 8-bit operation, selects 1-line |   |
|      | 0     | 0       | 0     | 0   | 1   | 1   | 0   | 0   | 0   | 0       |   | display and $V_{LCD} = V_0$                           |
| 3    | Disp  | lay_ctl |       |     |     |     |     |     |     |         |   | turns on display and cursor; entire                   |

## 16.11 8-bit operation, 2-line display

For a 2-line display the cursor automatically moves from the first to the second line after the 40th digit of the first line has been written. Thus, if there are only 8 characters in the first line, the DDRAM address must be set after the 8th character is completed (see Table 43). It should be noted that both lines of the display are always shifted

LCD controllers/drivers

together; data does not shift from one line to the other.

Table 43. 8-bit operation, 2-line display example; using external reset (character set 'A')

## LCD controllers/drivers

### 16.14 User defined characters and symbols

Up to 16 user defined characters may be stored in the CGRAM. The content of the CGRAM is lost during power-down, therefore the CGRAM has to be rewritten after every power-on.

013aaa144

Fig 48. User defined euro currency sign

Below some source code is printed, which shows how a user defined character is defined - in this case the euro currency sign. The display used is a 2 lines by 16 characters display and the interface is the I<sup>2</sup>C-bus:

```
// Write a user defined character into the CGRAM
startI2C();
// PCF2119 slave address for write, SAO is connected to Vdd
SendI2CAddress(0x76);
// MSB (Continuation bit Co) = 0, more than one byte may follow. Bit6, RS=0, next byte
// is command byte
i2c_write(0x00);
// 2 lines x 16, 1/18 duty, basic instruction set. Next byte will be another command.
i2c_write(0x24);
// Set CGRAM address to 0
i2c_write(0x40);
// Repeated Start condition
startI2C();
SendI2CAddress(0x76);
// RS=1, next byte is a data byte
i2c_write(0x40);
// Here the data bytes to define the character
// Behind the write commands the 5x8 dot matrix is shown, the 1 represents a on pixel.
// The Euro currency character can be recognized by the 0/1 pattern (see Figure 48)
i2c_write(0x06); // 00110
i2c_write(0x09); // 01001
i2c write(0x08); // 01000
i2c_write(0x1E); // 11110
i2c_write(0x1E); // 11110
i2c write(0x08); // 01000
i2c_write(0x09); // 01001
```

```
i2c_write(0x06); // 00110
i2c stop();
// Until here the definition of the character and writing it into the CGRAM. Now it
// still needs to be displayed. See below.
// PCF2119, setting of proper display modes
startI2C();
// PCF2119 slave address for write, SAO is connected to Vdd
SendI2CAddress(0x76);
// MSB (Continuation bit Co) = 0, more than one byte may follow. Bit6, RS=0, next byte
// is command byte
i2c_write(0x00);
// 2 lines x 16, 1/18 duty, extended instruction set. Next byte will be another
// command.
i2c_write(0x25);
// Set display configuration to right to left, column 80 to 1. Row data displ. top to
// bottom,1 to 16.
i2c_write(0x06);
// Set to character mode, full display, icon blink disabled
i2c_write(0x08);
// Set voltage multiplier to 2
i2c_write(0x40);
// Set Vlcd and store in register VA
i2c_write(0xA0);
// Change from extended instruction set to basic instruction set
i2c write(0x24);
// Display control: set display on, cursor off, no blink
i2c write(0x0C);
// Entry mode set, increase DDRAM after access, no shift
i2c_write(0x06);
// Return home, set DDRAM address 0 in address counter
i2c write(0x02);
\ensuremath{//} Clear entire display, set DDRAM address to 0 in address counter
i2c_write(0x01);
// Repeated Start condition because RS needs to be changed from 0 to 1
startI2C();
SendI2CAddress(0x76);
// RS=1, next byte is data
i2c_write(0x40);
// Write the character at address 0, which is the previously defined Euro currency
// character
i2c_write(0x00);
i2c_stop();
```

| AM4    | -   | <b>−745</b> | -3599 |  |

# 18. Handling information

All input and output pins are protected against ElectroStatic Discharge (ESD) under normal handling. When handling Metal-Oxide Semiconductor (MOS) devices ensure that all normal precautions are taken as described in *JESD625-A*, *IEC 61340-5* or equivalent standards.

# 19. Packing information

## 19.1 Packing information on the tray

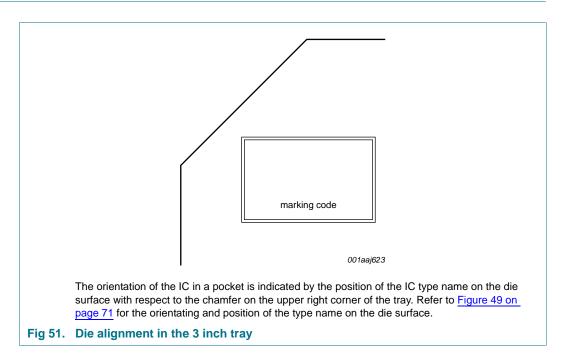

LCD controllers/drivers

Table 50. Specification of 3 inch tray details

Tray details are shown in Figure 50. Nominal values without production tolerances.

LCD controllers/drivers

## 23. Legal information

#### 23.1 Data sheet status

| Document status[1][2]          | Product status[3] | Definition  |
|--------------------------------|-------------------|---|
| Objective [short] data sheet   | Development       | This document contains data from the objective specification for product development. |
| Preliminary [short] data sheet | Qualification     | This document contains data from the preliminary specification.                       |
| Product [short] data sheet     | Production        | This document contains the product specification.                                     |

- [1] Please consult the most recently issued document before initiating or completing a design.
- [2] The term 'short data sheet' is explained in section "Definitions"
- [3] The product status of device(s) described in this document may have changed since this document was published and may differ in case of multiple devices. The latest product status information is available on the Internet.

#### 23.2 Definitions

Draft — The document is a draft version only. The content is still under internal review and subject to formal approval, which may result in modifications or additions. NXP Semiconductors does not give any representations or warranties as to the accuracy or completeness of information included herein and shall have no liability for the consequences of use of such information.

Short data sheet — A short data sheet is an extract from a full data sheet with the same product type number(s) and title. A short data sheet is intended for quick reference only and should not be relied upon to contain detailed and full information. For detailed and full information see the relevant full data sheet, which is available on request via the local NXP Semiconductors sales office. In case of any inconsistency or conflict with the short data sheet, the full data sheet shall prevail.

**Product specification** — The information and data provided in a Product data sheet shall define the specification of the product as agreed between NXP Semiconductors and its customer, unless NXP Semiconductors and customer have explicitly agreed otherwise in writing. In no event however, shall an agreement be valid in which the NXP Semiconductors product is deemed to offer functions and qualities beyond those described in the Product data sheet.

#### 23.3 Disclaimers

Limited warranty and liability — Information in this document is believed to be accurate and reliable. However, NXP Semiconductors does not give any representations or warranties, expressed or implied, as to the accuracy or completeness of such information and shall have no liability for the consequences of use of such information. NXP Semiconductors takes no responsibility for the content in this document if provided by an information source outside of NXP Semiconductors.

In no event shall NXP Semiconductors be liable for any indirect, incidental, punitive, special or consequential damages (including - without limitation - lost profits, lost savings, business interruption, costs related to the removal or replacement of any products or rework charges) whether or not such damages are based on tort (including negligence), warranty, breach of contract or any other legal theory.

Notwithstanding any damages that customer might incur for any reason whatsoever, NXP Semiconductors' aggregate and cumulative liability towards customer for the products described herein shall be limited in accordance with the *Terms and conditions of commercial sale* of NXP Semiconductors.

Right to make changes — NXP Semiconductors reserves the right to make changes to information published in this document, including without limitation specifications and product descriptions, at any time and without notice. This document supersedes and replaces all information supplied prior to the publication hereof.

Suitability for use — NXP Semiconductors products are not designed, authorized or warranted to be suitable for use in life support, life-critical or safety-critical systems or equipment, nor in applications where failure or malfunction of an NXP Semiconductors product can reasonably be expected to result in personal injury, death or severe property or environmental damage. NXP Semiconductors and its suppliers accept no liability for inclusion and/or use of NXP Semiconductors products in such equipment or applications and therefore such inclusion and/or use is at the customer's own risk

**Applications** — Applications that are described herein for any of these products are for illustrative purposes only. NXP Semiconductors makes no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

Customers are responsible for the design and operation of their applications and products using NXP Semiconductors products, and NXP Semiconductors accepts no liability for any assistance with applications or customer product design. It is customer's sole responsibility to determine whether the NXP Semiconductors product is suitable and fit for the customer's applications and products planned, as well as for the planned application and use of customer's third party customer(s). Customers should provide appropriate design and operating safeguards to minimize the risks associated with their applications and products.

NXP Semiconductors does not accept any liability related to any default, damage, costs or problem which is based on any weakness or default in the customer's applications or products, or the application or use by customer's third party customer(s). Customer is responsible for doing all necessary testing for the customer's applications and products using NXP Semiconductors products in order to avoid a default of the applications and the products or of the application or use by customer's third party customer(s). NXP does not accept any liability in this respect.

Limiting values — Stress above one or more limiting values (as defined in the Absolute Maximum Ratings System of IEC 60134) will cause permanent damage to the device. Limiting values are stress ratings only and (proper) operation of the device at these or any other conditions above those given in the Recommended operating conditions section (if present) or the Characteristics sections of this document is not warranted. Constant or repeated exposure to limiting values will permanently and irreversibly affect the quality and reliability of the device.

Terms and conditions of commercial sale — NXP Semiconductors products are sold subject to the general terms and conditions of commercial sale, as published, unless otherwise agreed in a valid written individual agreement. In case an individual agreement is concluded only the terms and conditions of the respective agreement shall apply. NXP Semiconductors hereby expressly objects to applying the customer's general terms and conditions with regard to the purchase of NXP Semiconductors products by customer.

**No offer to sell or license** — Nothing in this document may be interpreted or construed as an offer to sell products that is open for acceptance or the grant, conveyance or implication of any license under any copyrights, patents or other industrial or intellectual property rights.

**Export control** — This document as well as the item(s) described herein may be subject to export control regulations. Export might require a prior authorization from competent authorities.

Non-automotive qualified products — Unless this data sheet expressly states that this specific NXP Semiconductors product is automotive qualified, the product is not suitable for automotive use. It is neither qualified nor tested in accordance with automotive testing or application requirements. NXP Semiconductors accepts no liability for inclusion and/or use of non-automotive qualified products in automotive equipment or applications.

In the event that customer uses the product for design-in and use in automotive applications to automotive specifications and standards, customer (a) shall use the product without NXP Semiconductors' warranty of the product for such automotive applications, use and specifications, and (b) whenever customer uses the product for automotive applications beyond NXP Semiconductors' specifications such use shall be solely at customer's own risk, and (c) customer fully indemnifies NXP Semiconductors for any liability, damages or failed product claims resulting from customer design and use of the product for automotive applications beyond NXP Semiconductors' standard warranty and NXP Semiconductors' product specifications.

**Translations** — A non-English (translated) version of a document is for reference only. The English version shall prevail in case of any discrepancy between the translated and English versions.

Bare die — All die are tested on compliance with their related technical specifications as stated in this data sheet up to the point of wafer sawing and are handled in accordance with the NXP Semiconductors storage and transportation conditions. If there are data sheet limits not guaranteed, these will be separately indicated in the data sheet. There are no post-packing tests performed on individual die or wafers.

NXP Semiconductors has no control of third party procedures in the sawing, handling, packing or assembly of the die. Accordingly, NXP Semiconductors assumes no liability for device functionality or performance of the die or systems after third party sawing, handling, packing or assembly of the die. It is the responsibility of the customer to test and qualify their application in which the die is used.

All die sales are conditioned upon and subject to the customer entering into a written die sale agreement with NXP Semiconductors through its legal department.
